Genitourinary Masterclass

The value of molecular imaging and its impact on treatment choices

Professor Bertrand Tombal
Professor Fabio Calabrò

Prescribing Information is available at the end of this presentation.
This promotional meeting is fully sponsored and supported by Astellas, including speaker-related honoraria and production of materials. It is intended for healthcare professionals only.

UK: Adverse events should be reported.
Reporting forms and information can be found at https://yellowcard.mhra.gov.uk/ or search for 'MHRA yellow card' in the Google Play Store or Apple App Store. Adverse events should also be reported to Astellas Pharma Ltd on 0800 783 5018

NL: Reporting of suspected adverse reactions
Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions via the national reporting system. Nederland: Nederlands Bijwerkingen Centrum Lareb; Website: www.lareb.nl

Xtandi™ enzalutamide

astellas

MAT-NL-XTD-2025-00034 | July 2025

XTANDI™ (enzalutamide) indications

XTANDI is indicated, as per the EMA SmPC:

- As monotherapy or in combination with ADT for the treatment of adult men with high-risk biochemical recurrent non-metastatic HSPC who are unsuitable for salvage radiotherapy
- In combination with ADT for the treatment of adult men with mHSPC
- For the treatment of adult men with high-risk non-metastatic CRPC
- For the treatment of adult men with mCRPC who are asymptomatic or mildly symptomatic after failure of ADT and in whom chemotherapy is not yet clinically indicated
- For the treatment of adult men with mCRPC whose disease has progressed on or after docetaxel therapy

XTANDI is subject to medicinal prescription.
Astellas Pharma B.V., Sylviusweg 62, 2333 BE Leiden, The Netherlands.
ADT, androgen deprivation therapy; EMA, European Medicines Agency; CRPC, castration-resistant prostate cancer; HSPC, hormone-sensitive prostate cancer; mCRPC, metastatic castration-resistant prostate cancer; mHSPC, nmetastatic hormone-sensitive prostate cancer; SmPC, Summary of Product Characteristics.
XTANDI (enzalutamide). Summary of Product Characteristics.

Next-generation imaging: How does it impact the evidence seen in trials?

A tale of diagnostic accuracy and clinical utility

Professor Bertrand Tombal
Université Catholique de Louvain and Cliniques Universitaires Saint-Luc,
Brussels, Belgium

MAT-NL-XTD-2025-00034 | July 2025

Disclosures

- Professor and Chairman, Division of Urology, Cliniques universitaires Saint Luc, Brussels, Belgium
- Past President, European Organization Of Research and Treatment of Cancer (EORTC)
- Investigator and paid advisor for Amgen, Astellas, Bayer, Janssen, Ferring, Pfizer, Sanofi, Myovant
- The speaker has received an honorarium from Astellas for this presentation
- **This presentation reflects the personal view of Bertrand Tombal**

mHSPC segmentation

Synchronous (de novo)

Low volume

High volume

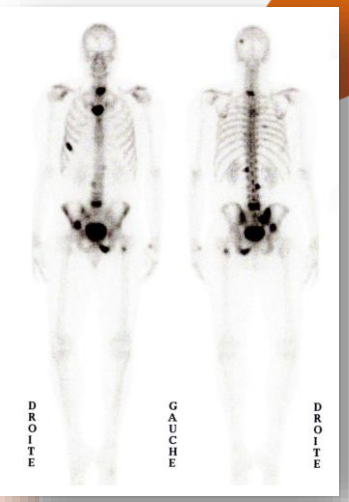
Metachronous (metastases post diagnosis)

A.L. 63 year old (low-volume mHSCP)

Characteristics	
Notes:	Mild urinary symptoms (IPSS 15) No co-morbidities DRE T3a
Gleason:	5/12 + target Gleason Grade ISUP 5
PSA:	14.6 ng/ml
Metastases:	1 large 20 mm PI-RADS 5 lesion and 1 pelvic bone metastases
Bone scan:	1 hot spot left pubic-bone

DP. A. 71 years old (high-volume mHSPC)

Characteristics	
Notes:	Acromio-clavicular pain No comorbidities
Gleason:	7
PSA:	>2500 ng/ml
ALP:	450 UI/L
Metastases:	Multiple bone metastases, including peripheral negative CT



D.J 69 yo. (asynchronous low-volume mHNCP-oligo recurrent)

Characteristics	
Notes:	2012: brachytherapy for intermediate risk-localised PCa T1c
Gleason:	2012: Gleason 7 (3+4)
PSA:	2012: 7.2 ng/ml PSA nadir: 1.2 ng/ml 2018: 2.1 ng/ml 2019: 19.4 ng/ml
Metastases:	1 bone metastases
CT scan:	No lymph nodes, 1 bone metastases

D.J 71 yo. (asynchronous high-volume mHSPC)

Characteristics	
Notes:	2017: RRP for high-risk localised PCa (pT3a R0 N0)
Gleason:	9 (5+4)
PSA:	2017: 17.2 ng/ml PSA nadir: 0.01 ng/ml 2018: 4.4 ng/ml
Metastases:	multiples lung metastases confirmed by EBUS
Bone scan:	Negative

MAT-NL-XTD-2025-00034 | July 2025

EMBARK: A Phase 3 RCT study of ENZ or PBO + leuprolide acetate and ENZ monotherapy in high-risk BCR prostate cancer

	Enzalutamide monotherapy (n=355)	Leuprolide acetate (n=358)
Median follow-up, mo	60.7	60.6
Events, n (%)	63 (17.7)	92 (25.7)
Per BICR, median MFS (95% CI), mo	NR (NR)	NR (85.1–NR)

HR for metastasis or death (95% CI): 0.63 (0.46–0.87); *P*=0.005†

Adapted from Freedland SJ, et al. *N Engl J Med* 2023.
Data cutoff: January 31, 2023. Symbols indicate censored data.
*MFS defined as the time from randomisation to the date of earliest objective evidence of imaging-based progression by central imaging or death due to any cause. †The HR was based on a Cox regression model with treatment as the only covariate stratified by screening PSA, PSADT, and prior hormonal therapy as reported in the IWRS; relative to leuprolide acetate <1 favoring enzalutamide monotherapy; the two-sided P-value was based on a stratified log-rank test.
ADT, androgen deprivation therapy; BCR, biochemically recurrent; BICR, blinded independent central review; CI, confidence interval; ENZ, enzalutamide; HR, hazard ratio; ITT, intention-to-treat; MFS, metastasis-free survival; mo, months; NR, not reached; PBO, placebo.
Freedland SJ, et al. *N Engl J Med* 2023;389:1453–1465.

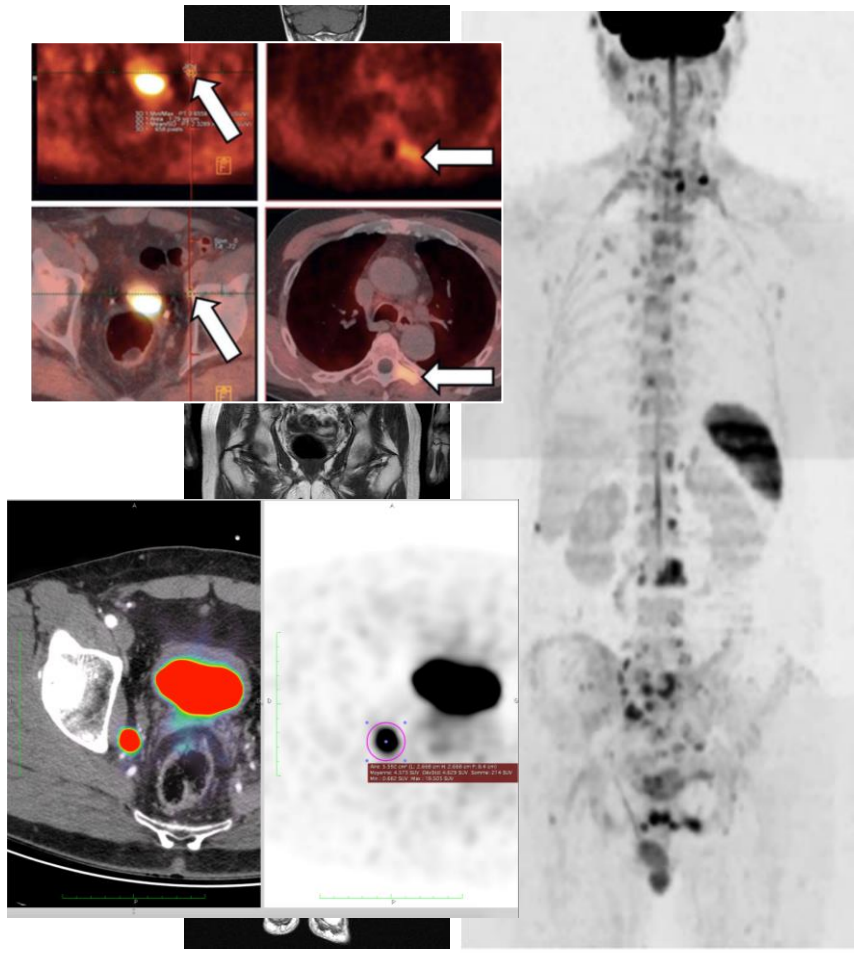
From conventional to next-generation imaging…



Diagnostic accuracy[1]

- Whole-body MRI and various PETs have been tested
- They significantly improve diagnostic accuracy
- If you use them in newly diagnosed high-risk PCa on SIM, you will end-up with “a lot” of oligometastatic patients…

Review

Consensus on molecular imaging and theranostics in prostate cancer [2]

Stefano Fanti, Silvia Minozzi, Gerald Antoch, Ian Banks, Alberto Briganti, Ignasi Carrio, Arturo Chiti, Noel Clarke, Matthias Eiber, Johann De Bono, Karim Fizazi, Silke Gillessen, Sam Gledhill, Uwe Haberkorn, Ken Herrmann, Rodney J Hicks, Frederic Lecouvet, Rodolfo Montironi, Piet Ost, Joe M O'Sullivan, Anwar R Padhani, Jack A Schalken, Howard I Scher, Bertrand Tombal, R Jeroen A van Moorselaar, Heindrik Van Poppel, Hebert Alberto Vargas, Jochen Walz, Wolfgang A Weber, Hans-Jürgen Wester, Wim J G Oyen

MRI, magnetic resonance imaging; PCa, prostate cancer; PET, positron emission tomography; SIM, systematic imaging modalities.

WB-MRI assessment of metastatic spread in PCa: Therapeutic perspectives on targeted management of oligometastatic disease

Distribution of metastatic disease according to the target organ (bones, nodes, both) in 96 metastatic PCa patients (46 mHSPC and 50 mCRPC)

Site	All patients		≤3 metastases	
	mHSPC	mCRPC	mHSPC	mCRPC
Lymph nodes only, n (%)	13 (28)	17 (34)	3 (6.5)	11 (22)
Bone only, n (%)	14 (29)	16 (32)	7 (15)	11 (22)
Lymph nodes and bone, n (%)	19 (41)	17 (34)	3 (6.5)	3 (6)
Total	46	50	13	25

13/46 oligometastatic M+ on new imaging modalities

Distribution of abnormal LN within and outside the accepted eLND and RTOG/CTV area, here delineated based on Joniau et al. and Lawton et al.

	mHSPC (n=46)	mCRPC (n=50)
LN distribution regarding eLND area		
No Abnormal lymph nodes detected within the eLND the standard template or bone metastases	14	16
Abnormal lymph nodes within eLND standard template only	7*	10*
Abnormal lymph nodes outside the eLND standard template or bone metastases	25*	24*
LN distribution regarding RTOG/CTV irradiation area		
No abnormal lymph nodes detected within RTOG/CTV standard template	14*	16*
Abnormal lymph nodes detected within RTOG/CTV standard template only	12*	15*
Abnormal lymph nodes outside the RTOG/CTV standard template or bone metastases	20*	19*

Most lymph nodes detected outside standard treatment template

Adapted from Larbi A, et al. *Prostate*. 2016.

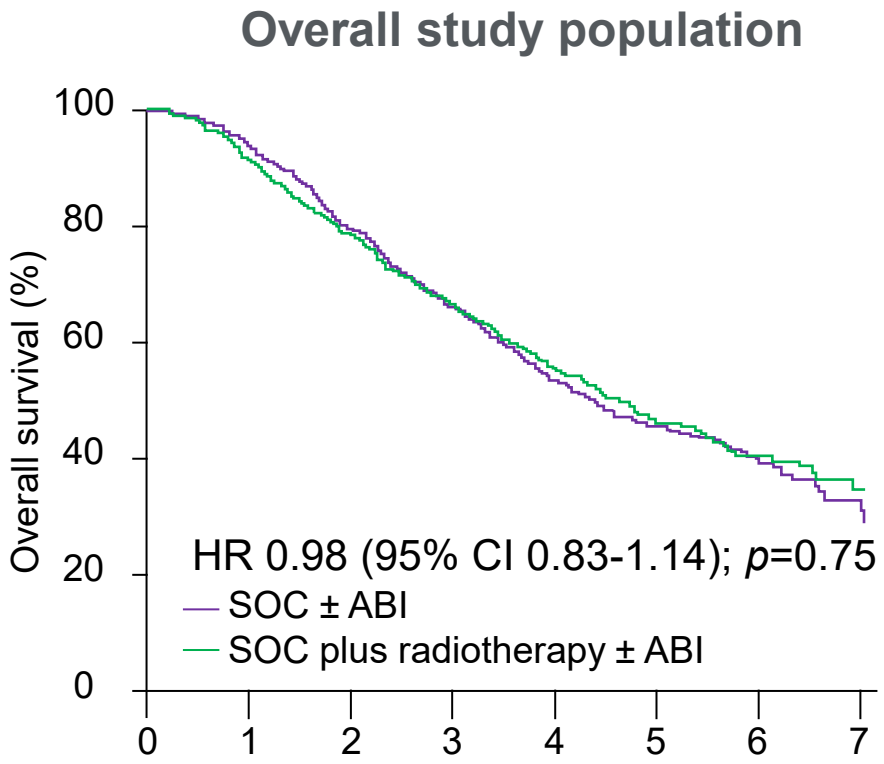
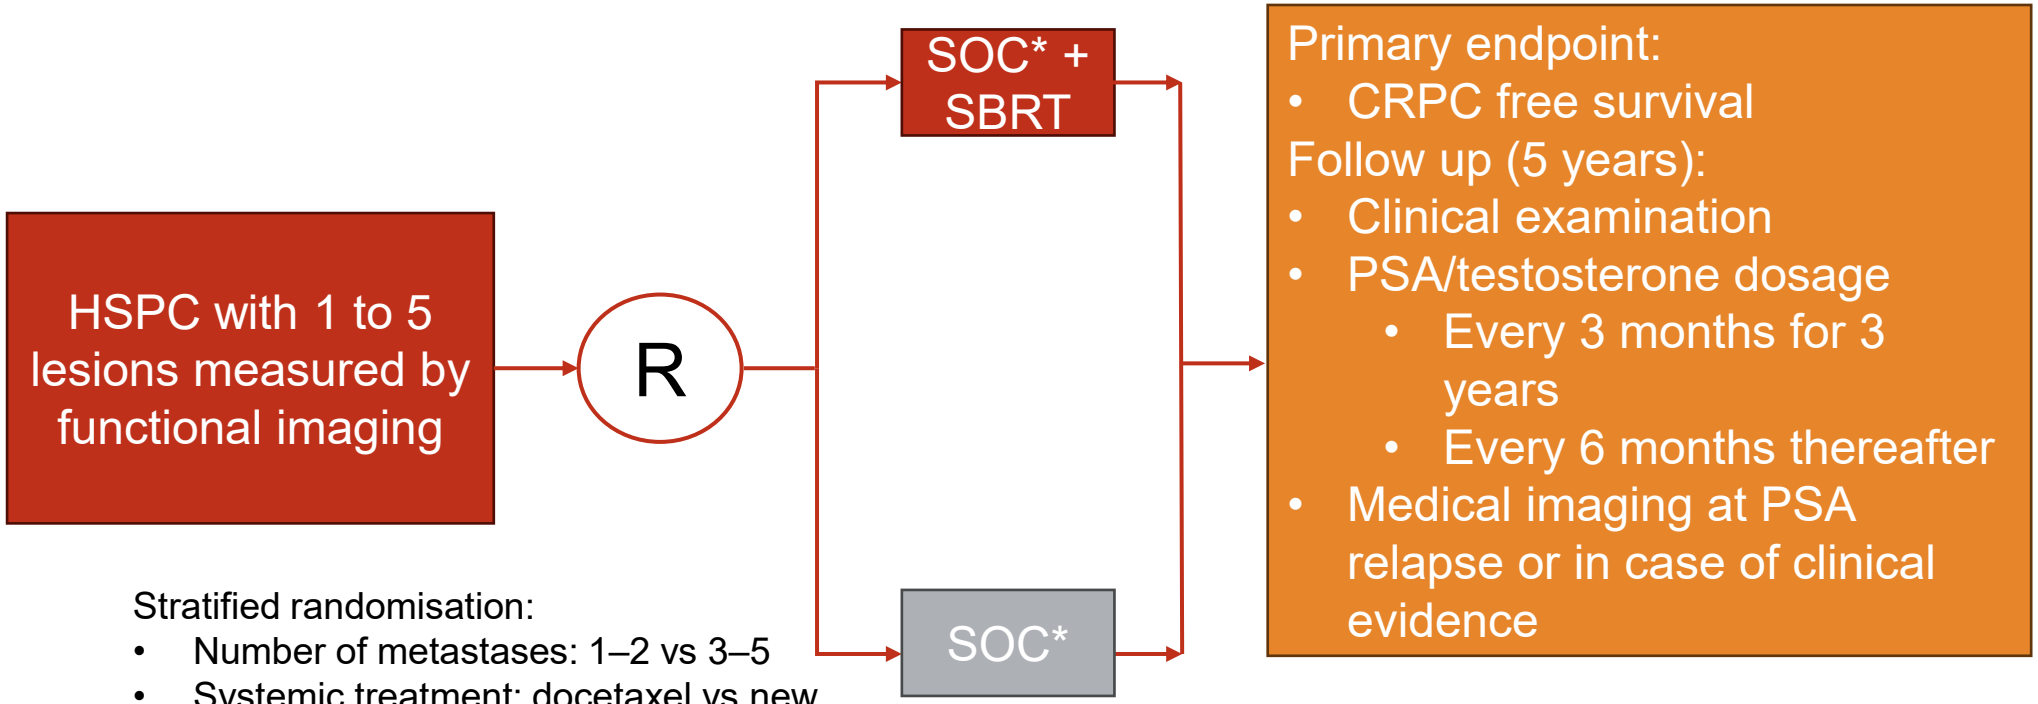
Received docetaxel as a component of SOC, n (%)	127 (50.2)	127 (50.4)	355 (60.4)	355 (60.8)



Adapted from Bossi A, et al. *Lancet* 2024;404:2065–2076.
*High volume was characterised by ≥4 bone metastases with one or more metastasises outside the vertebral bodies or pelvis, or visceral metastases, or both; low volume was characterised as all other assessable situations.
ABI, abiraterone; CI, confidence interval; HR, hazard ratio; mHSPC, metastatic hormone sensitive prostate cancer; PSA, prostate-specific antigen; RT, radiotherapy; SOC, standard of care.
Bossi A, et al. *Lancet* 2024;404:2065–2076.

PEACE 6– Oligo PRESTO: PCa treatment using SRT for oligometastases ablation in hormone-sensitive patients – a GETUG-AFU Phase 3 randomised controlled trial

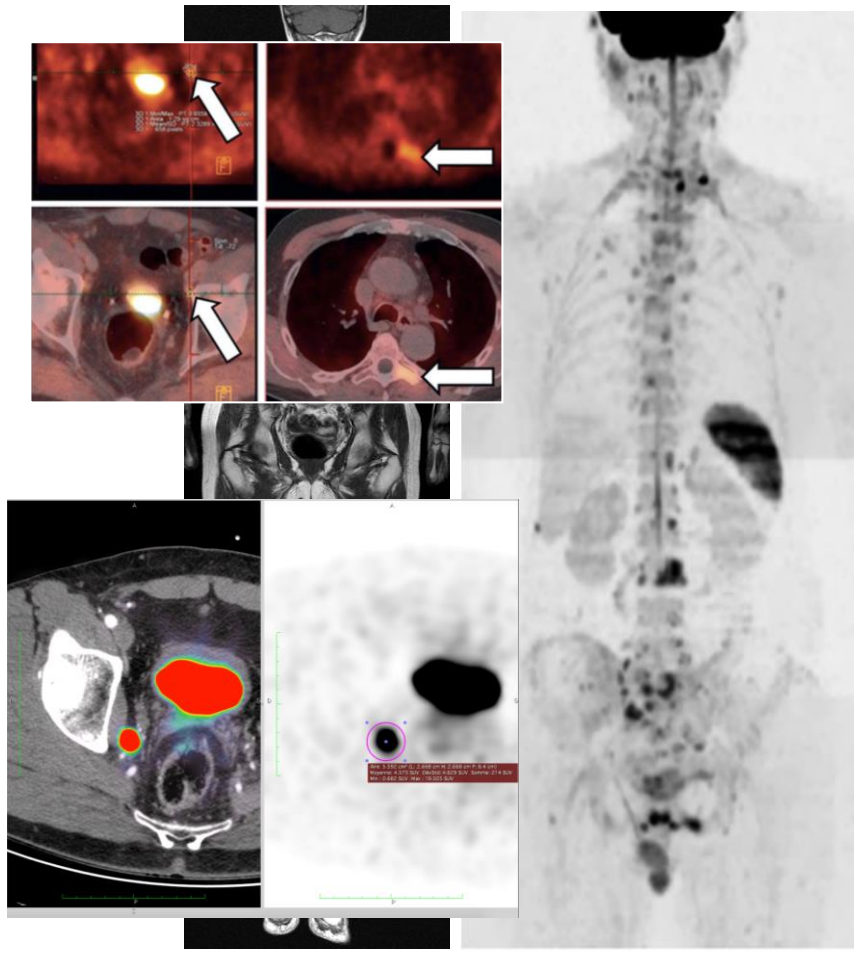


Stratified randomisation:
- Number of metastases: 1–2 vs 3–5
- Systemic treatment: docetaxel vs new generation hormonal therapy vs no treatment
- M1 disease: de novo vs previously treated (local) (defined as a recurrence occurring >6 months after local treatment

*Definition of standard of care (prior to randomisation):
•RT to the prostate in de novo metastatic patients
•RT to the pelvic lymph nodes in patients with positive pelvic nodes (given as full dose to the positive lymph node and prophylactic dose to the pelvic nodal basin)
•Long term ADT +/- intermittent treatment
•Additional therapy following tumour board meeting: Hormonal therapy (abiraterone, enzalutamide, apalutamide or other approved) or chemotherapy (docetaxel).

Adapted from NCT04115007.
ADT, androgen-deprivation therapy; CRCP, castration-resistant prostate cancer; HSPC, hormone sensitive prostate cancer; PCa, prostate cancer; RT, radiotherapy; SBRT, sterotatic body radiotherapy; SRT, salvage radiotherapy.
NCT04115007. Available at: Study Details | Prostate-cancer Treatment Using Stereotactic Radiotherapy for Oligometastases Ablation in Hormone-sensitive Patients | ClinicalTrials.gov. Last accessed: June 2025;
MAT-NL-XTD-2025-00034 | July 2025

From conventional to next-generation imaging…



Clinical Utility

- **mHSPC**
- The SOC nowadays is combining ADT and an ARPI[1]
- Intensification with docetaxel goes well beyond volume[2]
- NGIT are required to confirm the oligometastastic status, but MDT is still investigational in that setting[3]

Images copyrighted to CUSL, Brussels (BE0416.885.016).
ADT, androgen deprivation therapy; MDT, metastasis-directed therapy; NGIT, next-generation imaging technologies.

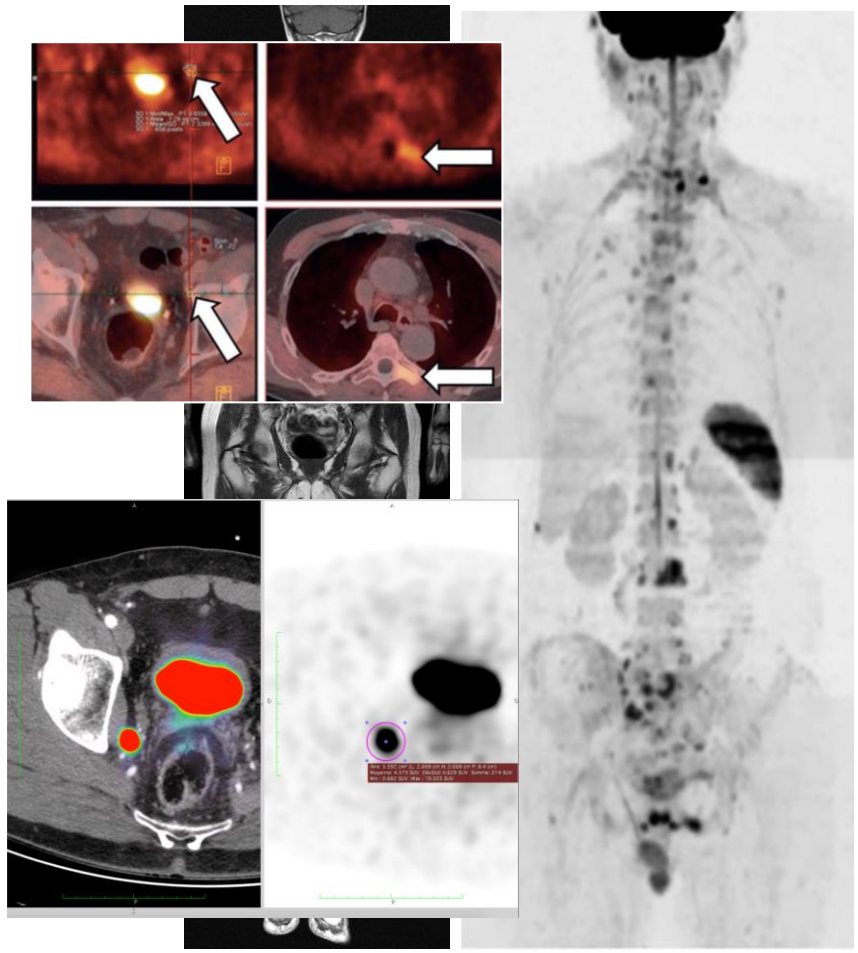
From conventional to next-generation imaging…



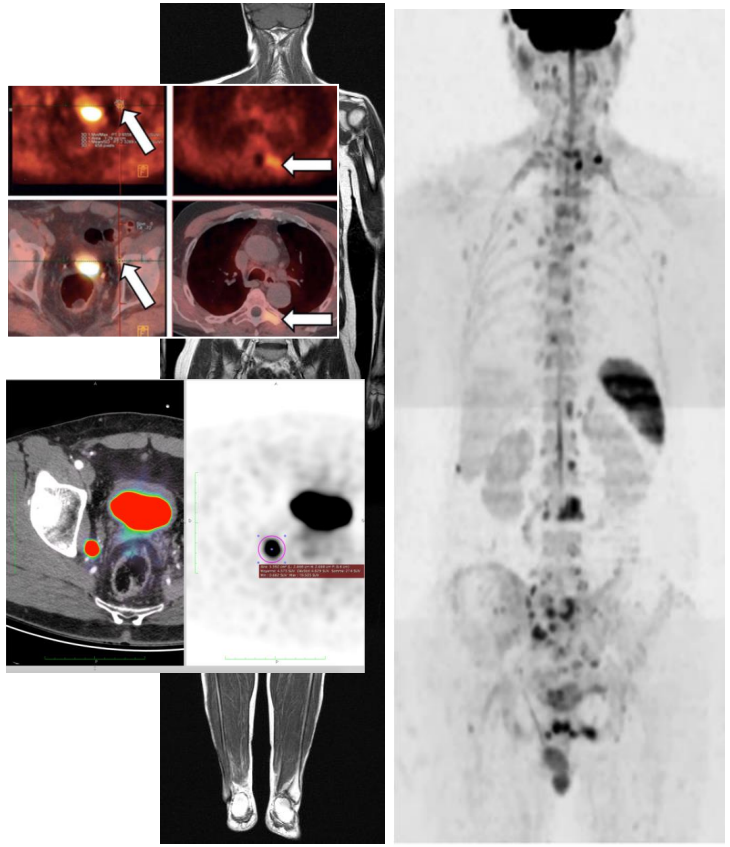
Clinical Utility

nmHSPC (BCR)

- The reference treatment of high-risk BCR is enzalutamide[1]
- NGIT will reveal a significant proportion of patients with oligometastastic disease[1]
- Delaying the initiation of enzalutamide (±ADT) is no longer an option after EMBARK[2]
- We need to redefine the role of NGIT and MDT[1]

Images provided by B.Tombal & F.Lecouvet, Clinique Universities Saint-Luc, Belgium
ADT, androgen deprivation therapy; BCR, biochemical recurrence; MDT, metastasis directed therapy; NIT, next-generation imaging techniques; nmHSPC, non-metastatic hormone sensitive prostate cancer.
1. Speaker's own opinion; 2. Freedland SJ, et al. *N Engl J Med* 2023;389:1453–1465.
MAT-NL-XTD-2025-00034 | July 2025

Next-generation imaging: How does it change the evidence seen in trials?



- Next-generation imaging technology are here to stay
- In the end, they challenge our willingness to study rather than disseminate
- Whether we are happy treating our patient on the acceptability of low impact data, it’s entirely up to us
- But I believe patients deserve definitive evidence and not conventional wisdom

Images provided by B.Tombal & F.Lecouvet, Clinique Universities Saint-Luc, Belgium
Speaker’s own opinion.

Case study

- 68-year-old man
- ECOG PS of 0
- No relevant family history
- No urinary symptoms
- Hypertension;
  on treatment with
  an ACE inhibitor

Fictitious patient case study created for illustrative purposes.
ACE, angiotensin-converting enzyme; ECOG PS, Eastern Cooperative Oncology Group performance status.

Case study

- 68-year-old man
- ECOG PS of 0
- No relevant family history
- No urinary symptoms
- Hypertension;
  on treatment with
  an ACE inhibitor

Diagnosis

Screening PSA = 7 ng/ml

Fictitious patient case study created for illustrative purposes.

ACE, angiotensin-converting enzyme; ECOG PS, Eastern Cooperative Oncology Group performance status; PSA, prostate-specific antigen.

Case study

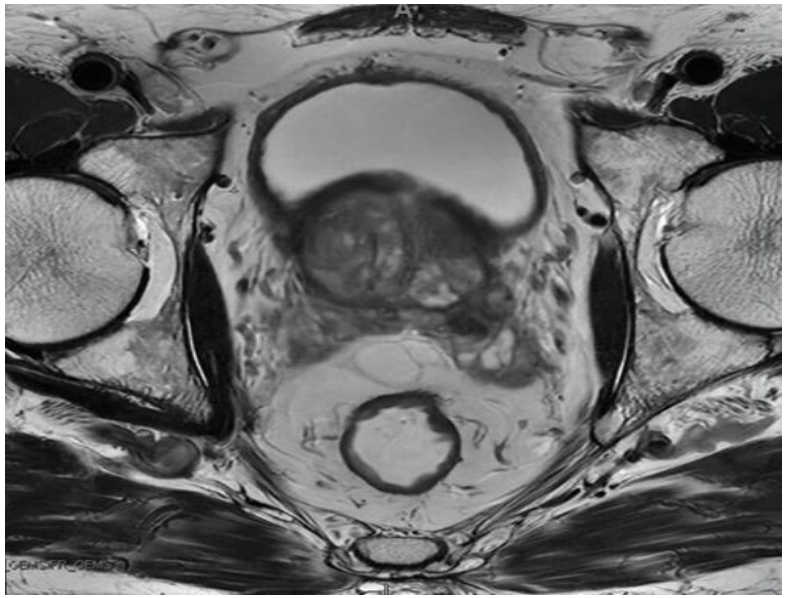
- 68-year-old man
- ECOG PS of 0
- No relevant family history
- No urinary symptoms
- Hypertension; on treatment with an ACE inhibitor

Diagnosis

Screening PSA = 7 ng/ml

Assessment

Multi-parametric prostate MRI



- 2.8 cm on the left with capsule bulging
- Left inferior seminal vesicle invasion
- No suspicious pelvic adenopathy or bone lesions
- PI-RADS 5

Fictitious patient case study created for illustrative purposes. Clinical image provided by the presenter.
ACE, angiotensin-converting enzyme; ECOG PS, Eastern Cooperative Oncology Group performance status; MRI, magnetic resonance imaging; PI-RADS, Prostate Imaging-Reporting and Data System; PSA, prostate-specific antigen.

Case study

- 68-year-old man
- ECOG PS of 0
- No relevant family history
- No urinary symptoms
- Hypertension;
  on treatment with
  an ACE inhibitor

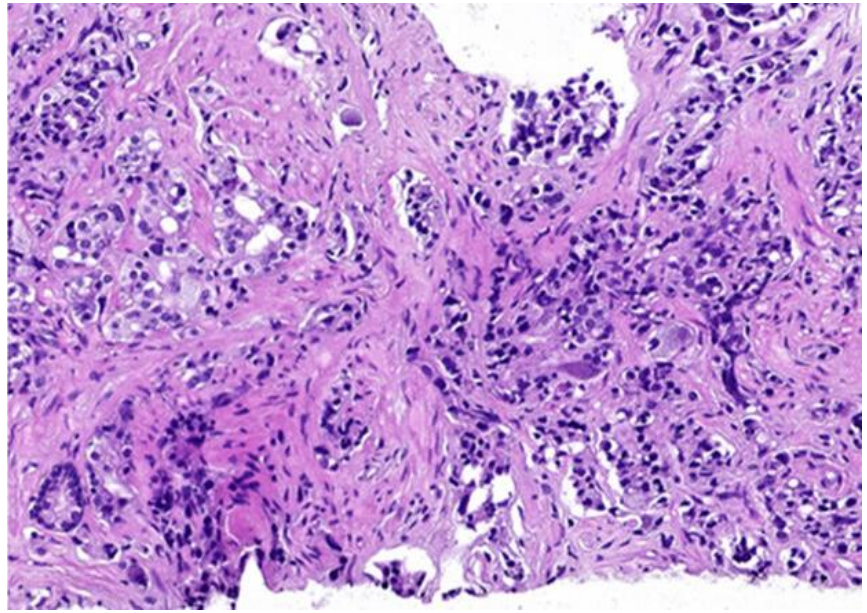
Diagnosis

Screening PSA = 7 ng/ml
MRI = PI-RADS score of 5

Assessment

Biopsy

- Grade Group 5 acinar adenocarcinoma in 7/12 cores
- Six left-sided cores positive



Fictitious patient case study created for illustrative purposes. Histological image provided by the presenter.
ACE, angiotensin-converting enzyme; ECOG PS, Eastern Cooperative Oncology Group performance status; MRI, magnetic resonance imaging; PI-RADS, Prostate Imaging-Reporting and Data System; PSA, prostate-specific antigen.

What imaging would you obtain to evaluate the extent of disease?

- **A** Combined abdomen and pelvis CT scan and bone scan
- **B** ^{18}F-fluciclovine PET scan
- **C** PSMA PET scan
- **D** Whole-body MRI with DWI

Fictitious patient case study created for illustrative purposes.

^{18}F, fluorine-18; CT, computed tomography; DWI, diffusion-weighted imaging; MRI, magnetic resonance imaging; PET, positron emission tomography; PSMA, prostate-specific membrane antigen.

MAT-NL-XTD-2025-00034 | July 2025

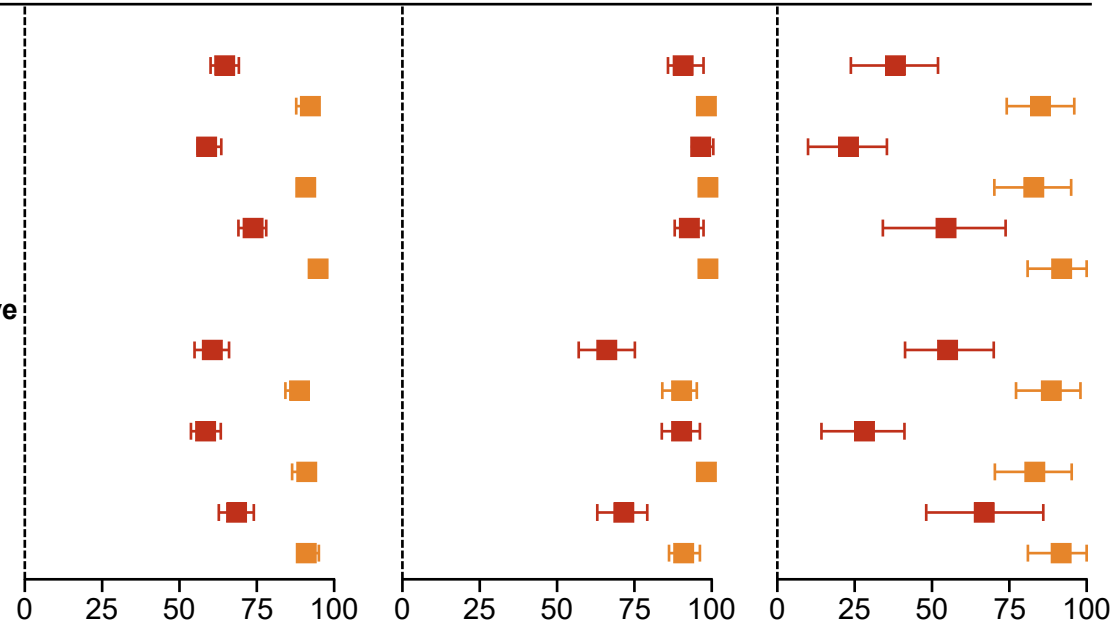
MAT-NL-XTD-2025-00034 | July 2025

PSMA PET in high-risk prostate cancer

proPSMA trial

Accuracy, sensitivity and specificity of conventional imaging compared with PSMA PET/CT

	N	Positive True/False	Negative True/False
Primary analysis			
Any metastatic disease	150	18/19	94/29
	145	34/2	103/6
Pelvic nodal	150	9/4	106/31
	145	29/1	109/6
Distant metasases	150	13/9	117/11
	145	22/1	120/2
Sensitivity analysis: equivocal lesions treated as positive			
Any metastatic disease	150	26/35	68/21
	145	35/11	94/5
Pelvic nodal	150	11/11	99/29
	145	29/2	108/6
Distant metasases	150	16/37	89/8
	145	22/11	110/2



These stage modifications were associated with modifications in the management plan in 15% of patients with conventional imaging vs. 28% of patients with PSMA PET, and a shift from curative to palliative care in 14% of patients who underwent first-line PSMA PET

Adapted from Hofman MS, et al. *Lancet* 2020.

AUC, area under the curve; CI, confidence interval; CT, computed tomography; PET, positron emission tomography; PSMA, prostate-specific membrane antigen.

Hofman MS, et al. *Lancet* 2020;395:1208–1216.

What systemic treatment do you recommend?

- **A** ADT doublet
- **B** ADT alone
- **C** ADT triplet
- **D** ADT +chemotherpy

Fictitious patient case study created for illustrative purposes.
ADT, androgen deprivation therapy.
MAT-NL-XTD-2025-00034 | July 2025

MAT-NL-XTD-2025-00034 | July 2025

Case study

- 68-year-old man
- ECOG PS of 0
- No relevant family history
- No urinary symptoms
- Hypertension;
  on treatment with
  an ACE inhibitor

Diagnosis

Screening PSA = 7 ng/ml
MRI = PI-RADS score of 5
Biopsy = adenocarcinoma GG 5

Assessment

PSMA PET = PSMA uptake in prostate gland, right obturator and internal iliac node, T11

Treatment

ADT + enzalutamide
RT of prostate

Fictitious patient case study created for illustrative purposes.
ACE, angiotensin-converting enzyme; ADT, androgen deprivation therapy; ECOG PS, Eastern Cooperative Oncology Group performance status; GG, Grade Group; MRI, magnetic resonance imaging; PET, positron emission tomography; PI-RADS, Prostate Imaging-Reporting and Data System; PSA, prostate-specific antigen; PSMA, prostate-specific membrane antigen; RT, radiotherapy.

For this patient, would you consider metastasis-directed therapy?

A No

B Yes

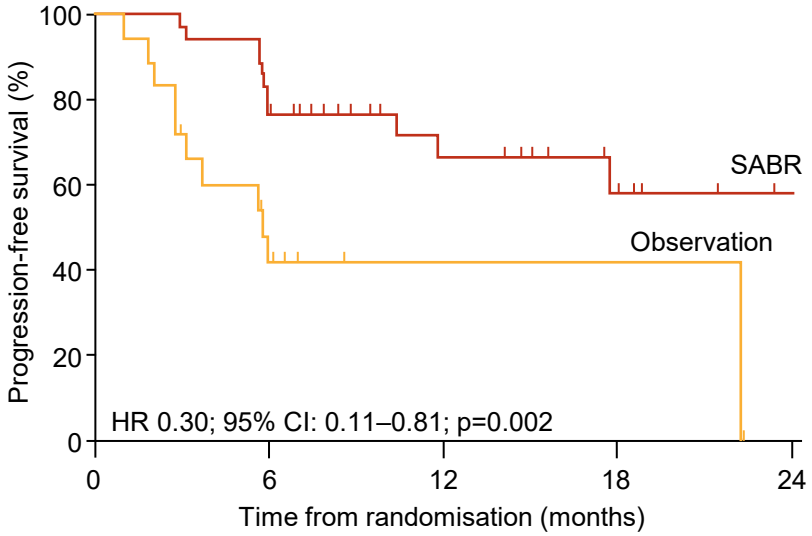
C Only in symptomatic sites

D Only for CRPC

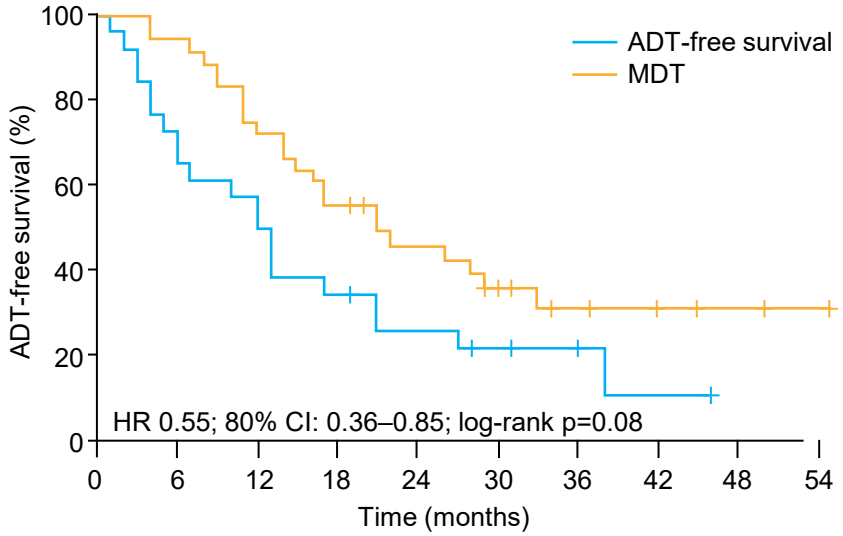
Fictitious patient case study created for illustrative purposes.
CRPC, castration-resistant prostate cancer.
MAT-NL-XTD-2025-00034 | July 2025

Metastasis-directed therapy
STOMP and ORIOLE trials

Composite PFS stratified by study arm[1]

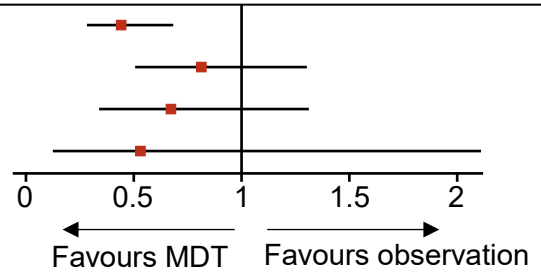


ADT-free survival vs. MDT (per-protocol analysis)[2]



Time-to-event outcomes of MDT vs. observation[3]

Outcome	MDT Median Time to Event, months (95% CI)	Observation Median Time to Event, months (95% CI)	HR (95% CI)	p-value
PFS	11.9 (8–18.3)	5.9 (3.2–7.1)	0.44 (0.29–0.66)	<0.001
rPFS	18.3 (12–36)	17 (13–22.8)	0.81 (0.50–1.29)	0.37
CRPC	NR (62–NR)	63 (53.9–NR)	0.67 (0.34–1.31)	0.24
OS	NR (84–NR)	NR (73–NR)	0.53 (0.13–2.11)	0.36



Adapted from Phillips R, et al. *JAMA Oncol* 2020, Ost P, et al. *J Clin Oncol* 2018 and, Deek MP, et al. *J Clin Oncol* 2022.[1–3]

ADT, androgen deprivation therapy; CI, confidence interval; CRPC, castration-resistant prostate cancer; HR, hazard ratio; MDT, metastasis-directed therapy; NR, not reached; OS, overall survival; PFS, progression-free survival; rPFS, radiographic progression-free survival; SABR, stereotactic ablative radiotherapy.

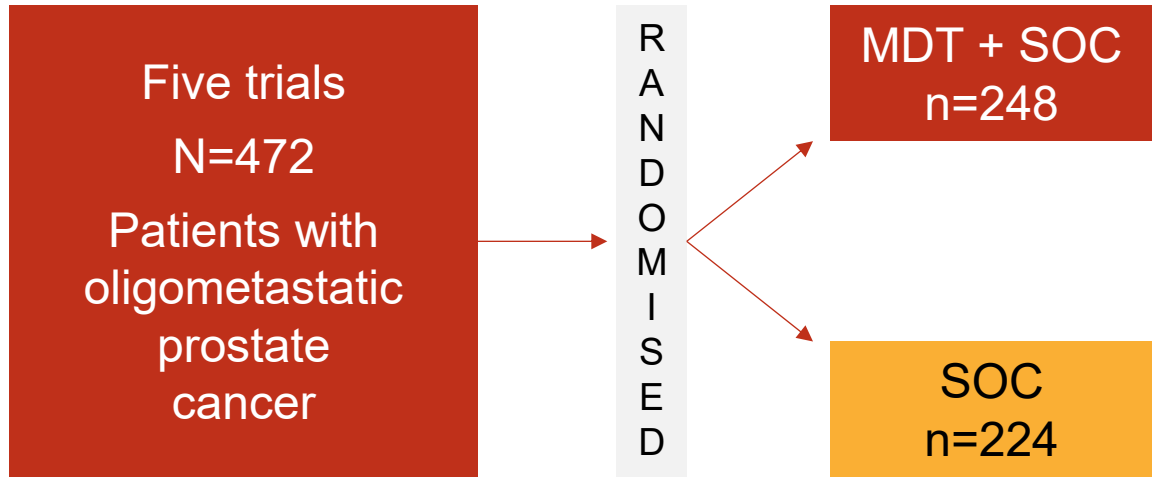
Worldwide oligometastatic prostate cancer meta-analysis

	SOC	SOC + MDT
Second-generation ARPI, n (%)	134 (60%)	125 (50%)
ADT alone, n (%)	40 (18%)	52 (21%)
Observation, n (%)	50 (22%)	69 (28%)
Median PSA at enrolment, ng/ml	1.9	1.9
Number of metastases, n	2	2
CRPC, n (%)	104 (46%)	95 (38%)
HSPC, n (%)	120 (54%)	153 (62%)
Primary treated, no, n (%)	37 (17%)	42 (17%)
Primary treated, yes, n (%)	185 (83%)	204 (82%)
Baseline conventional imaging, n (%)	79 (35%)	110 (44%)
Baseline PET imaging, n (%)	145 (65%)	138 (56%)

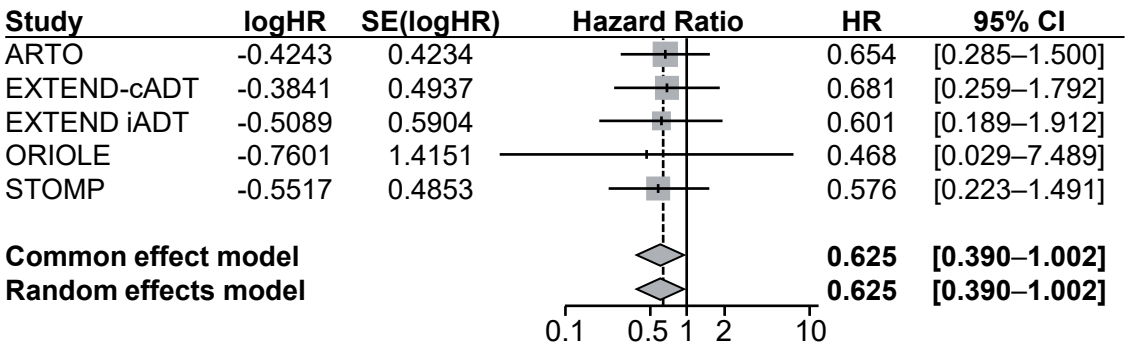


Median follow-up: 41 months

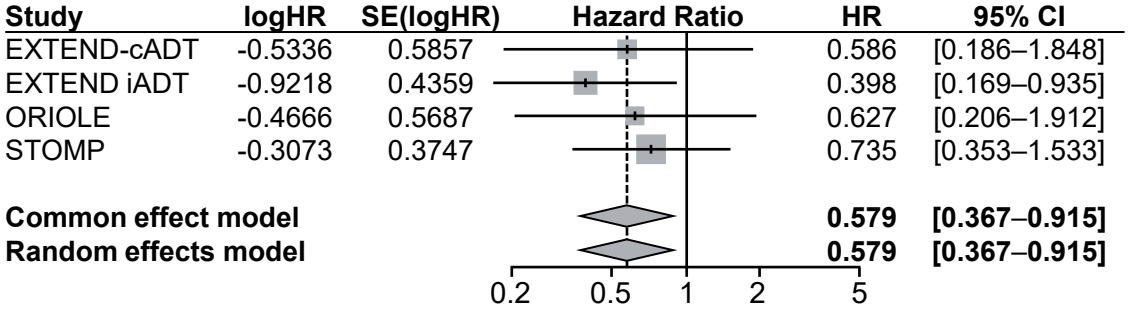
Adapted from Tang C, et al. Presented at ASCO GU 2025,
ADT, androgen deprivation therapy; ARPI, androgen receptor pathway inhibitor; CRPC, castration-resistant prostate cancer; HSPC, hormone-sensitive prostate cancer; MDT, metastasis-directed therapy; PET, positron emission tomography; PSA, prostate-specific antigen; SOC, standard of care.
Tang C, et al. Presented at ASCO GU 2025, 13–15 February 2025, San Francisco, CA, USA. Abstract 15.

Worldwide oligometastatic prostate cancer meta-analysis

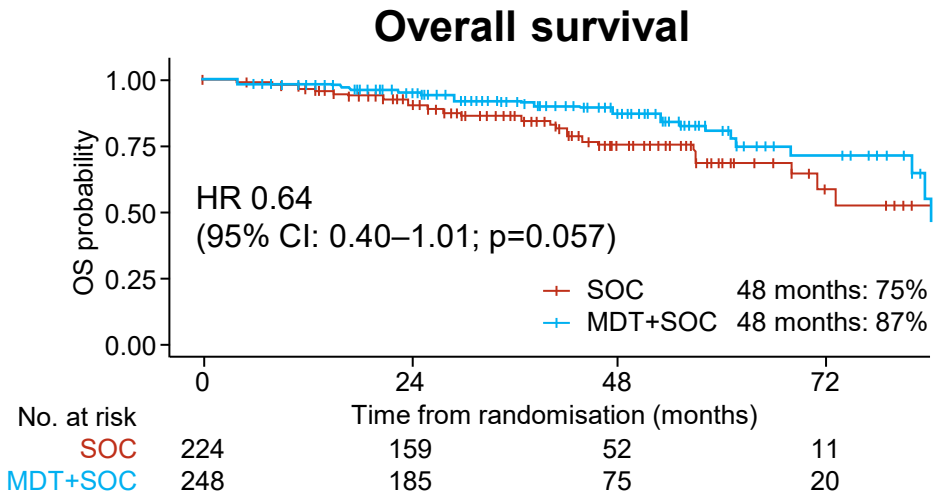
Castration-sensitive population

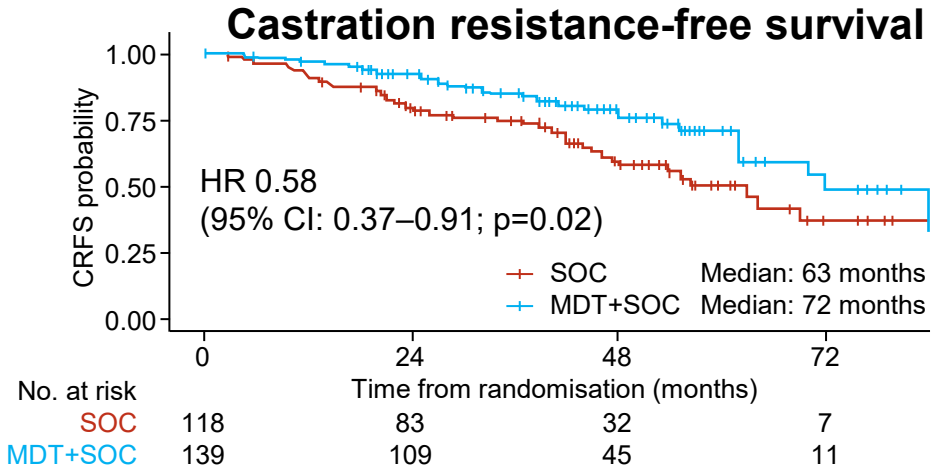


Heterogeneity: I^2=0%, τ^2=0, p=1.00



Heterogeneity: I^2=0%, τ^2=0, p=0.76





Adapted from Tang C, et al. Presented at ASCO GU 2025,
cADT, continuous androgen deprivation therapy; CI, confidence interval; CRFS, castration resistance-free survival; HR, hazard ratio; iADT, intermittent androgen deprivation therapy; MDT, metastasis-directed therapy; SE, standard error; SOC, standard of care.
Tang C, et al. Presented at ASCO GU 2025, 13–15 February 2025, San Francisco, CA, USA. Abstract 15.

Take-home messages

- PSMA PET has demonstrated greater accuracy, sensitivity and specificity than combined conventional imaging for detection of metastases for high-risk prostate cancer in RCTs[1]
- Doublet therapy with ADT + ARPI is the standard of care for patients with metastatic castration-sensitive prostate adenocarcinoma; including those with synchronous oligometastatic disease[2]
- A subgroup analysis of RCTs has shown a role of radiation to the prostate in the realm of oligometastatic HSPC[3–6]
- Metastasis-directed therapy has emerged as an option in patients with oligorecurrent HSPC, and its role in *de novo* oligometastatic HSPC will be determined in ongoing trials[6]

ADT, androgen deprivation therapy; ARPI, androgen receptor pathway inhibitor; HSPC, hormone-sensitive prostate cancer;
PET, positron emission tomography; PSMA, prostate-specific membrane antigen; RCT, randomised controlled trial.
